Hi all, I am the owner of **Clubsport** 64. I am rebuilding the front splitter and crush box and trying to learn the car. What are the threaded bosses at the lower front corners of the frame for? I assume the upper ones are for splitter supports.

Here is a picture of the work in progress

The upper and lower threaded bosses are the attachment points for the "nose frame." The cars were not originally designed with a crush box of any kind, and as a result came with a nose support frame that bolted to the **chassis** via the 4 threaded bosses. Once a crush box was designed, it attached to the front of the **chassis** (much the same way yours does) and the threaded bosses went unused.

I'll see if I can dig up a picture of the original nose frame. Jake Latham probably has one on his website somewhere.

-Matt

Thank you!

That information clears up a lot of head scratching and eliminates concerns about repurposing the mounts.

Chris
